

Maintenance and handling

- The panels should be stacked fabric to fabric and back to back.
- Installers and handlers should always wear clean cotton gloves to ensure the good condition of the panels.
- Cleaning should be done with a vacuum and a soft brush attachment.
- Cleaning of vinyls may be done with some mild soap and a well wrung cloth. The cloth should be only damp to the touch. This will prevent clogging of the perforations and ensure the acoustic properties of the panel.
- Avoid use of alcohol or petroleum based cleaners.
- Always test your cleaning product on a hidden area of the panel (ie. back side) to be sure you do not damage the panel.

Installation guidelines

- The panels should be installed in a clean and dust-free environment.
- The ideal temperature for the panels is between - (60F) and 30c (85F) where the relative humidity does not exceed 70 %.
- Panels must be stored on site 24 hours before installation.
- The hanging surface should be clean and dust free.
- After all panels have been installed, minor adjustment can be made to ensure proper alignment and jointing.
- The installation contractor should have a minimum of five years experience with this type of work, and should have a qualified and experienced staff.
